INSTRUCTIONS DE MONTAGE

INSTRUCCIONES PARA LA COLOCACION

MONTAGEANLEITUNG

INSTRUÇÕES DE INSTALAÇÃO

Italiano

Descrizione

Scala a chiocciola modulare in metallo/legno a pianta circolare regolabile in altezza tramite distanziatori metallici interposti tra i gradini.

Nr. gradini e altezze raggiungibili per scale "filo-pavimento"

11 + 1 gradini : 2520 - 2760 mm

12 + 1 gradini : 2730 - 2990 mm

13 + 1 gradini : 2940 - 3220 mm

Gradini

Di faggio fingerjoint, spessore 38 mm . Gradini semplici (30°) e pianerottolo di arrivo "Universale".

Alzate

Standard Min. 210 mm ; Max 230 mm (per alzate 200 ÷ 210 mm; 230 ÷ 240 mm si possono adattare le colonne in fase di posa).

Ringhiera

A colonne in tubo di metallo Ø 22 mm (luce max tra le colonne < 100 mm). Corrimano di materiale plastico flessibile (ht. corrimano = 1 m).

Finitura e colori

Parti di legno: tonalizzate con vernice all'acqua (Naturale 12/Noce 16)

Parti di metallo: verniciate a forno con polveri epossidiche (Nero goffrato/Grigio Argento).

Componenti in plastica, gomma e viteria: nero/grigio.

NOTE PER LA POSA

Prima di procedere con la posa:

- **verificare le dimensioni del vano scala;**
- **controllare che, nelle zone dove verranno effettuati i fissaggi della scala, non vi siano tubature o cavi elettrici, onde evitarne il danneggiamento;**
- **verificare la capacità di carico del pavimento**

1) Assemblare il palo nella sequenza indicata bloccando saldamente gli elementi fra loro, facendo leva con un perno negli appositi fori dei tubi.

2) Posizionare il palo in riferimento al foro, disponendo il gradino di arrivo sul lato di uscita della scala. Verificare l'esatta perpendicolarità al pavimento. Prima di bloccare lo sbarco, assicurarsi della sua perfetta orizzontalità utilizzando una livella. Prima di segnare la posizione dei fori della piastra del palo centrale sul pavimento, bloccare temporaneamente il gradino di sbarco per evitare spostamenti ed errori di misurazione. In caso di pavimenti/travi in legno utilizzare solo mordenti/viti da legno per sostituire quelle fornite, adatte solo per cemento armato.

3) Regolare i distanziali in plastica avvitando la ghiera filettata, lasciando tra le due battute una distanza pari a "Alzata - 160 mm". E' poi necessario aumentare l'altezza con mezzo giro in meno sul distanziale al fine di recuperare la compressione sul filetto della vite (tolleranza) in fase di serraggio di tutti i gradini.

N.B. Per la 1° alzata occorre tenere conto della piastra del palo centrale e dell'interferenza dovuta alla saldatura piastra – palo.

4) Inserire gli elementi nel palo iniziando dal copripiastra in basso, proseguendo con distanziali e gradini, sino all'inserimento del gradino di arrivo.

5) Posizionare il pianerottolo di arrivo. Tagliare il gradino di sbarco universale in funzione della forma di foro. In caso di pavimenti/travi in legno utilizzare solo mordenti/viti da legno per sostituire quelle fornite, adatte solo per cemento armato.

6) Inserire nel palo la flangia terminale, la barra filettata ed il terminale, quindi avvitare con il dado, in modo da comprimere la scala, ma lasciando ai gradini la libertà di ruotare.

7) Comporre il raccordo "Novia" assemblando gli elementi. Per l'assemblaggio dei componenti in plastica utilizzare sempre del grasso lubrificante.

8) Inserire le colonne in tutti i gradini, bloccando quelle passanti con i grani e quelle sul gradino con la boccola ad espansione "Espa". Bloccare bene l'inserito in plastica nella boccola di plastica prima di inserirlo nelle colonnine. Non avvitare troppo a fondo il grano perché potrebbe danneggiare la colonna durante il suo inserimento nel foro. Non serrare completamente i grani delle colonne passanti prima di aver terminato il serraggio della scala completa. Completare il serraggio solo dopo aver avvitato completamente la barra filettata M22 con il dado.

9) La prima colonna della scala va tagliata e fissata a terra tramite il "Bicchierino". In caso di pavimenti/travi in legno utilizzare solo mordenti/viti da legno per sostituire quelle fornite, adatte solo per cemento armato.

10) Regolazione colonne

Prima di bloccare le colonne eseguire la regolazione della pendenza in funzione dell'alzata.

11) Questo disegno mostra il kit "traversino/alzata" montato sul mod. GAMIA LEGNO. Se la colonnina del para alzata è troppo lunga, è necessario tagliarla a misura.

12-13) Montaggio balaustrino del gradino di arrivo

Forare il gradino di arrivo con punta Ø 10 mm utilizzando la sagoma di cartone in dotazione.

Disporre le colonne sul gradino di sbarco e inserirvi le cime: in corrispondenza del foro passante utilizzare una colonna da 1165 mm da tagliare a misura.

Fissare la colonna stop fornita per bloccare l'ultima colonna passante sul pianerottolo di sbarco (lato opposto al balaustrino) o l'ultima colonna del balaustrino.

Assemblare i corrimani alle colonne, fissando le cime con le apposite viti. Il corrimano va fissato prima sulle colonne passanti e poi su quelle centrali al gradino.

14-15) Montaggio Balastra

-Assemblare le colonne (ht. 925 mm) inserendo la boccola "Espa" ed avvitando il mordente.

-Tracciare sul pavimento il centro delle colonne mantenendo la distanza dal foro di circa 50 mm (l'interasse tra le colonne non deve superare i 120 mm).

- Forare con punta Ø 12 mm ed inserire gli espansori in nylon.

- In caso di pavimenti/travi in legno utilizzare solo mordenti/viti da legno per sostituire quelle fornite, adatte solo per cemento armato.

English

Description

Modular spiral staircase in metal/wood, with round section and adjustable spacers

Number of steps and "floor-to-floor" height

11 + 1 steps : 2520-2760 mm (8 3 1/4" - 9 0")

12 + 1 steps : 2730-2990 mm (8 11 1/2" - 9 9 3/4")

13 + 1 steps : 2940-3220 mm (9 7 3/4" - 10 6 3/4")

Steps

Of fingerjoint beech wood, thickness 38 mm (1 1/2").

Step angle 30°, "Universal" landing angle 60°.

Risers

Standard Min 210 mm (8 1/4"); Max 230 mm (9") (for risers 200 ÷ 210 mm (7 7/8" ÷ 8 1/4"); 230 ÷ 240 mm (9" ÷ 9 1/2")) it is possible to cut the balusters during the assembly)

Railing

With metal steel tubing balusters Ø 22 mm (7/8") (clear space among the balusters < 100 mm, 4").

Flexible plastic handrail (handrail height = 1000 mm, 39 3/8")

Finishes and colours

Wood: polished with water varnish (Natural 12/Walnut 16).

Metal: plastic coated (Embossed black/Silver grey).

Plastic componentes, rubber matting and screws: black/grey.

NOTES FOR INSTALLATION

Before starting to install the stair:

- check well all staircase well dimension;

-make sure that in the installation area there are no pipes or power cables to prevent damaging these;

- check the bearing capacity of the pavement.

1) Assemble the pole in the sequence indicated, locking the elements firmly together, levering using a pin in the holes in the tubes.

2) Position the post with reference to the opening, arranging the landing step on the exit side of the stair. Before securing the platform, make sure of its perfect horizontality by the use of the level tube. Before taking the measure of the holes in the floor for the center pole, block temporarily the platform on the pole to avoid traveling and measurement errors. In the case of wooden floor/slab use only screws for wood, of the hanger bolt/leg bolt type, to replace those provided exclusively suited to reinforced concrete.

3) Regulate the plastic spacers adjusting the ring nut, leaving between the two edges a distance equivalent to: Riser – 160 mm (6 11/16"). It is necessary to give a half turn more to the flange of all plastic spacers, so as to increase the average height and recover the tolerances of the threading when you compact the stair. Attention: in the first rise, from the average height of the plastic spacer must be deducted the thickness of the central pole plate.

4) Insert the elements in the post beginning from the plate cover, going on with spacers and steps and finishing with the landing.

5) Position the landing. trim the universal landing step according to the opening In the case of wooden floor / slab use only screws for wood, of the hanger bolt/leg bolt type, to replace those provided exclusively suited to reinforced concrete.

6) Insert the terminal flange, the threaded bar and the terminal in the pole, then tighten using the nut, in order to compress the staircase, but leaving the steps free to rotate.

7) Put together the pipe fitting "Novia" assembling the elements. For the assembly of plastic components of the railing always use the lubricating grease.

8) Insert balusters in all steps, doweling the ones that go through the step and locking the other ones with the expansion bushing "Espa". Lock well the plastic insert in the outer bush of plastic, before inserting it in the baluster. be careful not to overtighten the screw. check it before inserting the column into the hole Do not fully tighten all the fixing dowels of the passing balusters before having compacted the whole stair. Finish the definitive tightening only after having completely screwed the threaded rod with a M22 nut.

9) The first baluster of the stair need to be cut and secured to the floor with pipe fitting "Bicchierino". In the case of wooden floor/slab use only screws for wood, of the hanger bolt/leg bolt type, to replace those provided exclusively suited to reinforced concrete.

10) Balusters ajustement

Before baluster's tightening it is necessary to adjust the slope according to the risers.

11) This draw shows the assembling of "Safety-riser" for model Gamia Wood. if the safety riser baluster is too long, you need to resize it to measure

12-13) Assembling of landing balustrade

Drill holes in the landing step with a Ø 10 mm (3/8") bit, using the issued paper template. For the platform railing, in correspondence of the passing hole use the baluster 1165 mm long that is specially provided in the kit, to be cut to size. Fix the provided baluster-floor fixing element to block the last passing baluster on the landing platform (on the opposite side of the platform railing) or the last baluster of the platform railing.

The handrail of the stair must be fixed first to the passing balusters and secondly to the central balusters of the step.

14-15) Balusters assembling

- Assemble the balusters (Ht. 925 mm, 36 3/8") connecting the bushing "Espa" and screwing the fitting
- Mark out the floor the central position of the balusters for the balustrade, note also that a distance of about 50 mm (2") from the opening is needed and that the axle base among the balusters can't be over 120 mm (4 1/2")
- Drill holes with a Ø 12 mm (1/2"94) bit and insert the nylon expanders.
- In the case of wooden floor/slab use only screws for wood, of the hanger bolt / leg bolt type, to replace those provided exclusively suited to reinforced concrete.

Francais

Description

Escalier hélicoïdal modulaire en métal/bois à plan circulaire réglable en hauteur avec entretoises en métal entre les marches.

N. marches et hauteurs possibles au "niveau du sol"

- 11 + 1 marches : 2520 - 2760 mm
- 12 + 1 marches : 2730 - 2990 mm
- 13 + 1 marches : 2940 - 3220 mm

Marches

En hêtre fingerjoint, épaisseur 38 mm. Angle marches 30°, angle palier Universel 60°

Hauteur de marche

Standard Min. 210 mm; Max 230 mm (pour hauteurs 200 ÷ 210 mm; 230 ÷ 240 mm balustres adaptables pendant la pose).

Rampe

Avec balustres en tube de metal Ø 22 mm (distance entre les balustres < 100 mm). Main courante en materiel plastique flexible (hauteur main courante = 1 m).

Finitions et couleurs

Parties en bois : teintées avec vernis à l'eau (Naturel 12/Noyer 16)

Parties en métal : traitées en époxy (Noir gaufré/Gris argent).

Parties en plastique, tapis et visserie: noir/gris.

Vérifier les dimensions de la cage avant de procéder à la pose.

Vérifier que les fixations de l'escalier ne tombent pas sur des conduites ou des câbles électriques

- 1) Assembler le poteau.
- 2) Positionner le poteau dans l'axe exact de la trémie, en plaçant la marche d'arrivée sur le côté de sortie de l'escalier.
- 3) Régler les entretoises en plastique en serrant la bague filetée et en gardant une distance égale à "Hauteur de marche - 160 mm".
- 4) Empiler tour à tour les éléments (entretoises et marches) dans le poteau sans oublier au départ le couvreembase et terminer avec l'installation de la marche d'arrivée.
- 5) Positionner la marche d'arrivée.
- 6) Insérer dans le poteau le bride terminal.
- 7) Assembler le raccord "Novia" en montant les éléments.
- 8) Insérer les balustres dans toutes les marches en bloquant ceux du type passant avec les vis et ceux sur la marche avec l'expansion "Espa".
- 9) Découper et fixer au sol le premier balustre avec le gobelet "Bicchierino".

10) Réglage des balustres

Avant de bloquer les balustres, régler les en fonction de la pente créée par la hauteur de marche.

- 11) Ce dessin montre le kit bras/hauteur de marche assemblé sur le modèle GAMIA BOIS.

12-13) Montage de la rampe du palier d'arrivée

Percer la marche d'arrivée avec un foret Ø 10 mm en utilisant le gabarit en carton fourni.

14-15) Montage du garde-corps

- Assembler les balustres du garde-corps (h. 925 mm) en insérant la pièce "Espa" et en serrant le mordant.
- Tracer au sol l'axe des balustres du garde corps en gardant une distance par rapport au bord de la trémie d'environ 50 mm (L'entraxe entre les balustres ne doit pas excéder les 120 mm).
- Percer avec un foret Ø 12 mm et insérer les chevilles à expansion en nylon.

Descripción

Escalera de caracol modular de metal/madera con planta circular con altura regulable mediante los distanciadores de metal entre los peldaños.

Nº Peldaños y alturas totales posibles a "nivel del piso"

11 + 1 peldaños : 2520 - 2760 mm

12 + 1 peldaños : 2730 - 2990 mm

13 + 1 peldaños : 2940 - 3220 mm

Peldaños

De haya fingerjoint espesor 38 mm.

Ángulo de los peldaños simples 30°, ángulo de rellano universal 60°

Contrahuellas

Estándar Mín. 210 mm; Max 230 mm (para contrahuellas 200 ÷ 210 mm; 230 ÷ 240 mm los barrotes se pueden adaptar en fase de montaje).

Baranda

De barrotes en tubo de metal Ø 22 mm (luz entre los barrotes < 100 mm). Pasamanos de material plástico flexible (altura pasamanos = 1 m).

Acabado y colores

Piezas de madera: tintadas a base de agua (Natural 12/Nogal 16)

Piezas de metal: barnizadas al horno con polvos epoxídicos (Negro gofrado/Gris Plata).

Elementos de plástico, goma y tornillos: negros/gris.

Verificar las dimensiones del espacio donde irá la escalera antes de iniciar el montaje. Controlar que, en las zonas donde se efectuarán las fijaciones de la escalera, no haya tubos o cables eléctricos, para evitar daños.

- 1)** Montar el eje.
- 2)** Colocar el eje con referencia al orificio, poniendo el rellano de desembarque sobre el lado de salida de la escalera.
- 3)** Regular los distanciadores de plástico enroscando la virola roscada, dejando entre los dos toques una distancia equivalente a "Contrahuella - 160 mm".
- 4)** Insertar los elementos en el eje comenzando por la brida del eje, continuando con los distanciadores y los peldaños, hasta insertar el rellano de desembarque.
- 5)** Fijar el rellano de desembarque
- 6)** Insertar en el eje la brida terminal.
- 7)** Componer el acoplamiento "Novia" montando los elementos.
- 8)** Insertar los barrotes en todos los peldaños, bloqueando aquellos pasantes con los tornillos sin cabeza y aquellos sobre el peldaño con el casquillo de expansión "Espa".
- 9)** El primer barrote de la escalera se corta y se fija en el suelo mediante la taza "Bicchierino".

10) Regulación de los barrotes

Antes de bloquear los barrotes, hay que regular la pendencia en función de la contrahuella

11) Este diseño muestra el kit barra/contrahuella montado sobre el modelo GAMIA MADERA.

12-13) Montaje de la barandilla del rellano de desembarque

Perforar el rellano de desembarque con una punta Ø 10 mm utilizando la plantilla que viene en el paquete.

14-15) Montaje balaustra

- Montar los barrotes (ht. tot. 925 mm) metiendo el casquillo de expansión "Espa" y atornillando el mordente
- Señalar sobre el suelo el centro de los barrotes manteniendo la distancia desde el orificio de alrededor de 50 mm (la distancia entre los agujeros de los barrotes no tiene que superar los 120 mm)
- Perforar con una punta Ø 12 mm e introducir los expansores de nylon.

Deutsch

Beschreibung

Modulare Spindeltreppe aus Metall / Holz mit rundem Grundriss regulierbar mit Abstandstücken aus Metall

Anzahl der Stufen und Gesamthöhe der Treppe

11 + 1 Stufen : 2520 - 2760 mm

12 + 1 Stufen : 2730 - 2990 mm

13 + 1 Stufen : 2940 - 3220 mm

Stufen

Aus Massiver Buche mit einer Stärke von 38 mm Stufen (Winkel 30°), "Universal" Podest (Winkel 60°).

Steigungen

Standard Min. 210 mm; Max 230 mm (für Steigungen 200 ÷ 210 mm; 230 ÷ 240 mm verstellbar während der Montage).

Geländer

Mit Metallstäben Ø 22 mm (Distanz zwischen der Stäben max < 100 mm). Modulierbarer Handlauf aus Plastik (Höhe Handlauf = 1 m)

Oberflächenausführung und Farben

Holzteile: mit wasserlöslicher Beize versehen (Natur 12/Nussbaum)

Metallteile: Epoxyd-Einbrennlackierung (Schwarz gaufriert/Silbergrau).

Elemente aus Plastik, Auflagen und Schrauben: schwarz/grau.

Vor Beginn der Treppemontage messen Sie das Treppenhaus nach. Um Beschädigungen zu vermeiden, überprüfen Sie vor Beginn der Montage, daß sich in dem Bereich, in dem die Treppe befestigt wird, keine Rohrleitungen oder elektrische Kabel befinden.

1) Die Spindel zusammenbauen.

2) Die Spindel vollkommen ausrichten und dabei das Austrittspodest als Anhaltspunkt benutzen.

3) Die Distanzstücke zusammenbauen und den Gewindeflansch auf die erforderlich Auftrittshöhe einstellen und lassen Sie zwischen eine Höhe von „Steigung - 160 mm“ feststellen.

4) Alle Elemente in die Spindel einsetzen: Plattenabdeckung, Distanzstücken, Stufen und Austrittsstufe.

5) Das Podest befestigen.

6) Den Abschlussflansch einsetzen.

7) Das Anschlußstück "Novia" aus den einzelnen Elementen zusammenbauen.

8) Die durchführenden Stäbe müssen durch die Stifte befestigt werden. Die andere Stäbe in allen Stufen mit den Expansionsbuchsen „Espa“ einsetzen.

9) Das erste Stab der Treppe wird geschnitten und mit dem "Bicchierino" befestigt.

10) Einstellung der Stäbe

Vor der Befestigung der Stäbe muß die Steigung in Abhängigkeit von der Stufenhöhe eingestellt werden.

11) Die Zeichnung betrifft die Kit "Sicherheit der Steigung" für das Modell Gamia Holz. Was die Gamia Metall betrifft, so ist die Montageanleitung die gleiche.

12-13) Montage des Geländerpodest

Die Austrittsstufe mit einem Bohrer Ø 10 mm bohren und dabei die mitgelieferte Schablone verwenden.

14-15) Montage der Balustrade

- Die Stäbe der Balustrade (H 925 mm) zusammenbauen, in dem die „Espa“
- Buchsen eingesetzt werden; dann die selbstschneidende Schraube anziehen, bis sie greift
- Auf dem Boden die Mitte der Stäbe für die Balustrade anzeichnen und dabei berücksichtigen, dass ein Abstand von der Öffnung von ca. 50 mm eingehalten werden muss und dass der Abstand zwischen den Stäben nicht mehr als 120 mm betragen darf.
- Dann die Löcher mit einem Bohrer Ø 12 mm bohren und die Expansionselemente aus Nylon einsetzen: an diesem Punkt die Stäbe anschrauben und den Handlauf befestigen.

Português

Descrição

Escadaria em espiral modular em metal / madeira com planta circular regulável em alturas através de espaçadores metálicos interpostos entre os degraus.

Número de degraus e alturas alcançadas para escadas "nível-pavimento"

11 + 1 degraus : 2520 - 2760 mm

12 + 1 degraus : 2730 - 2990 mm

13 + 1 degraus : 2940 - 3220 mm

Degraus

De madeira de faia finger-joint, espessura 38 mm com fitas adesivas antiderrapantes. Degraus simples (30°), patamar de chegada "Universal" (60°).

Alturas do degrau

Standard Mín. 210 mm ; Máx 230 mm (para alturas do degrau $200 \div 210$ mm; $230 \div 240$ mm podem-se adaptar as colunas na fase de instalação).

Parapeito

De colunas em tubo de metal Ø 22 mm (luz máx entre as colunas < 100 mm). Corrimão de material plástico flexível (ht. corrimão = 1 m).

Acabamento e cores

Peças em madeira: reavivadas com tinta à base de água (Natural 12/Nogueira 16)

Peças em metal: pintadas com pó epóxico em forno (Preto gofrado/Cinza prateado).

Componentes em plástico, borracha e parafuso: preto/cinza.

Verifique as dimensões da caixa de escada antes de prosseguir com a instalação. Controlar se nas zonas onde serão efetuadas as fixações da escada, não existem tubos ou cabos elétricos, a fim de evitar danos

- 1) Montar o poste.
- 2) Colocar o poste em referência com o orifício, dispondo o degrau de chegada no lado de saída da escada
- 3) Regular os espaçadores de plástico apertando a bucha roscada, deixando entre as duas linhas uma distância igual a "Altura do degrau - 160 mm".
- 4) Inserir os elementos no poste a partir do cobre-placa na parte inferior, continuando com os espaçadores e os degraus, até à introdução do degrau de chegada.
- 5) Das Podest befestigen.
- 6) Inserir no poste a flange terminal.
- 7) Regular a ligação "Novia" montando os elementos.
- 8) Inserir as colunas em todos os degraus, bloqueando as passantes com os graus e as que se encontram sobre o degrau com a bucha de expansão "Espa".
- 9) A primeira coluna da escada deve ser cortada e fixada no solo através do "Encaixe".

10) Regulação das colunas

Antes de bloquear as colunas efetuar a regulação da pendência, em relação à altura do degrau.

- 11) Este desenho mostra o kit "escora/altura do degrau" montado no mod. GAMIA LEGNO.

12-13) Montagem do balaústre do degrau de chegada.

Perfurar o degrau de chegada com uma broca de Ø 10 mm utilizando o molde de cartão fornecido.

14-15) Montagem do Balaústre

- Montar as colunas (ht. 925 mm) introduzindo a bucha "Espa" e apertando o encaixe
- Marcar no pavimento o centro das colunas mantendo a distância do furo de cerca de 50 mm (a distância entre as colunas não deve ser superior a 120 mm)
- Perfurar com uma broca de Ø 12 mm e introduzir os expansores de nylon.

HT - Altezza totale da pavimento a pavimento (HPS+S)
HPS - Altezza da pavimento inferiore a soffitto (HT-S)
